                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             The invention relates to a method of preparing high yields of an (R)-hydroxy ester by reducing an alpha-keto ester using a ketoreductase enzyme. The present sequence represents Sporobolomyces salmonicolor ketoreductase, aldehyde reductase II used in the method of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         (R)-hydroxy ester; alpha-keto ester; ketoreductase;

The present sequence represents a Sporobolomyces salmonicolor ketoreductase, aldehyde reductase II, N-terminal peptide used in the method of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Preparing (R)-hydroxy ester involves adding alpha-keto ester to mixture comprising ketoreductase enzyme and non-ketoreductase enzyme components.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      (MOOR/)

promoter functional in a plant cell, where the promoter is positioned to provide for expression of a polynucleotide encoding a polypeptide from a microbial source. The invention also relates to a transformed plant comprising the recombinant DNA construct and a method of producing a transformed plant having an improved property. The plant is a crop plant such as maize or soybean. The method of producing a transformed plant having an improved property comprises transforming a plant with the recombinant DNA construct and growing the transformed plant, where the polynucleotide or polypeptide is useful for improving plant properties. The recombinant DNA construct is useful for producing plants with improved plant properties, e.g. improved cold, heat or drought tolerance, tolerance to herbicides, extreme osmotic conditions, pathogens or pests,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    nitrogen;

                                                                                                                                                                                                                                            New recombinant DNA construct comprising a promoter positioned to provide for expression of a polynucleotide encoding a polypeptide from a microbial source, useful for producing plants with improved properties.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Recombinant DNA construct; transformed plant; improved plant property; cold tolerance; heat tolerance; drought tolerance; herbicide; osmosis; pathogen tolerance; pest tolerance; plant disease resistance; plant disease resistance; cell cycle pathway modification; plant growth regulator; homologous recombination; seed oil yield; protein yield; carbohydrate;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 hydroxy ester by reducing an alpha-keto ester using a ketoreductase enzyme. The present sequence represents a Sporobolomyces salmonicolor ketoreductase, aldehyde reductase II, N-terminal peptide used in the method of the invention.
                                                                                                                                                                                      The invention relates to a recombinant DNA construct comprising
                                                                                                                                                                                                                 Claim 1; SEQ ID NO 14080; 122pp;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           of the cell cycle pathway with plant growth regulators, increased rate of homologous recombination, modified seed oil or protein yield and/or content, improved yield by modification of carbohydrate, nitrogen or phosphorus use and/or uptake, by modification of photosynthesis or by providing improved plant growth and development under at least one stress condition, improved lignin production or improved galactomannan production. This sequence represents a bacterial polypeptide used in the scope of the invention. Note: The sequence data for this patent did not form part of the printed specification but was obtained in electronic form.
                                                                                                                                                                                                                                                                                                                                                                                                                                                     Masignani V,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          09-OCT-1998;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Neisseria gonorrhoeae
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Neisseria meningitidis; Neisseria gonorrhoeae; antigen; vaccine;

N. gonorrhoeae antigenic proteins. They are encoded by open reading frames (ORFs) AAZ11972-Z12358. The antigenic proteins, their fragments, their nucleic acids and antibodies are used for diagnosis, prevention (as vaccines) or treatment of Neisseria infections, such as meningitis, septicaemia and gonorrhea. Both organisms are closely related. Fragments of the nucleic acids are useful as hybridisation probes and antisense

(as

Amino acid sequences AAY38499-Y38944 represent Neisseria meningitidis and

diagnosis,

Claim 4; Page

                                                                                                         Amino acid sequences AAY38499-Y38944 represent Neisseria meningitidis and N. gonorrhoeae antigenic proteins. They are encoded by open reading frames (ORFs) AAZ11972-Z12358. The antigenic proteins, their fragments, their nucleic acids and antibodies are used for diagnosis, prevention (as vaccines) or treatment of Neisseria infections, such as meningitis, septiceemia and gonorrhea. Both organisms are closely related. Fragments of the nucleic acids are useful as hybridisation probes and antisense
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     AAY38794;

                                                                                                                                                                                                                                                                                                                                                   The present sequence represents the amino acid sequence of a N. gonorrhoeae protein. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from USPTO at seqdata.uspto.gov/sequence.html?DocID=6914131B1.
                                                                                                                                                                                                                                                                                                                                                                                                     The invention relates to an isolated nucleic acid molecule. The methods and compositions of the present invention are useful for diagnosing and/or treating Neisserial bacterial infections, in particular meningitis and septicemia caused by Neisseria meningitidis and Neisseria gonorrhea.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            22-SEP-2005
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            AEB49406 standard; protein; 461

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      invention relates to an isolated nucleic acid molecule. The methods of compositions of the present invention are useful for diagnosing for treating Neisserial bacterial infections, in particular meningitis septicemia caused by Neisseria meningitidis and Neisseria gonorrhea. Present sequence represents the amino acid sequence of a N. present sequence represents the amino acid sequence of a N. present protein. Note: The sequence data for this patent did not form to the printed specification, but was obtained in electronic format ectly from USPTO at seqdata.uspto.gov/sequence.html?DocID=6914131B1.

Also disclosed are the nucleic acid molecules encoding the proteins ar antibodies that specifically bind to the proteins. The composition comprising the protein, nucleic acid or antibody is useful for the manufacture of a medicament for treating or preventing N. gonorrhoeae infection, this may be in the form of a vaccine or gene therapy. Sequences given in records ABP76736-ABP81046 represent nucleic acid molecules of the invention
                                                                       Amino acid sequences AAY38499-Y38944 represent Neisseria meningitidis and N. gonorrhoeae antigenic proteins. They are encoded by open reading frames (ORPs) AAZ11972-Z12358. The antigenic proteins, their fragments, their nucleic acids and antibodies are used for diagnosis, prevention (as vaccines) or treatment of Neisseria infections, such as meningitis, septicaemia and gonorrhea. Both organisms are closely related. Fragments of the nucleic acids are useful as hybridisation probes and antisense
                                                                                                                                                                                                                                                                                                                                    diagnosis,

They are encoded by open reading frames (ORFS) AAZ11972-Z12358. The antigenic proteins, their fragments, their nucleic acids and antibodies are used for diagnosis, prevention (vaccines) or treatment of Neisseria infections, such as meningitis, septicaemia and gonorrhea. Both organisms are closely related. Fragment, of the nucleic acids are useful as hybridisation probes and antisense

                                                                                                              The invention relates to an isolated nucleic acid molecule. The methods and compositions of the present invention are useful for diagnosing and/or treating Neisserial bacterial infections, in particular meningitis and septicemia caused by Neisseria meningitidis and Neisseria gonorrhea. The present sequence represents the amino acid sequence of a N. meningitidis protein. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from USPTO at
